Office Action Summary	Application No.		Applicant(s)	
	10/622,479		SHIBATA ET AL.	
	Examiner		Art Unit	
	Julian D. Huffman		2853	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 27 October 2005.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-24 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-24 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☒ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 25 April 2005 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
 Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
 Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some * c) ☐ None of:
1. ☒ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 30 September 2005 has been entered.

Specification

2. The abstract of the disclosure is objected to because of its length. Correction is required. See MPEP § 608.01(b).

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

4. Claims 1, 2, 4-8 and 10-24 are rejected under 35 U.S.C. 102(b) as being anticipated by Takahashi et al. (U.S. 5,838,342).

Takahashi et al. discloses:

With regards to claim 1, an ink jet printing apparatus which forms an image on a print medium by moving a print head (fig. 5, element 24) having an array of nozzles (fig. 15, n) and the print medium relative to each other and at the same time ejecting ink droplets from the nozzles according to print data of the image to be printed, the ink jet printing apparatus comprising:

nozzle information generation means (CPU 102, column 11, lines 23-24) for generating nozzle information representing an ejection characteristic of each nozzle according to a result of measuring a landing state of each of dots formed by the ink droplets which are ejected from the nozzles of the print head onto the print medium by measuring the landing state corresponding to each of the (CPU 102 receives density data from a density unevenness correction section shown in fig. 7, see column 12, lines 36-48 and column 14, lines 1-13 and generates nozzle information from the density data, column 19, lines 9-65, the density data is obtained by measuring a landing state of each dot, column 14, lines 1-13);

estimation means (CPU 102, column 11, lines 23-24) for estimating, based on the nozzle information generated by the nozzle information generation means and the print data, an effect that the ink droplet ejected from each nozzle has on the image to be formed (CPU 102 receives density data from a density unevenness correction section shown in fig. 7, see column 12, lines 36-48 and column 14, lines 1-13 and generates nozzle information from the density data, column 19, lines 9-65)

correction information means (CPU 102) for generating correction information to correct an ink ejection condition of each nozzle according to a result of estimation by the estimation means (column 19, line 66-column 20, line 8) and

control means (102) for controlling a driving of the nozzles according to the print data and the correction information (column 20, lines 4-8).

With regards to claim 2, the nozzle information generation means determines, as the nozzle information representing the ejection characteristic of each nozzle, an amount of deviation between an ideal landing position on the print medium of the ink droplet ejected from each nozzle of the print head and an actual landing position of the ink droplet on the print medium (column 1, lines 31-43 and column 14, lines 10-13 and 32-35, the nozzle information generation means determines the density, which represents a variation in landing position of droplets from an ideal position).

With regards to claims 4 and 5, the estimation means at least analyzes a component affecting a print density on the print medium, wherein the component is a range of print area to be printed by the ink dot and an area overrunning the range of print area (a test pattern is printed from all nozzles and measured, column 19, lines 3-8 and fig. 28).

With regards to claim 6, the correction information generation means generates, based on an estimated result from the estimation means, the correction information to correct the ink ejection conditions of nozzles unable to produce an ideal landing state (column 20, lines 1-8).

With regards to claims 7, 8, 10 and 11, a method involving performing the functions outlined above as steps for forming an image in an ink jet printer.

With regards to claims 12 and 13, an ink jet printing apparatus which forms an image on a print medium by moving a print head (fig. 5, element 24) having an array of nozzles (fig. 15, n) and the print medium relative to each other and at the same time

ejecting ink droplets from the nozzles according to print data of the image to be printed, the ink jet printing apparatus comprising:

grayscale correction means (CPU 102) for performing an ink dot grayscale correction according to density difference data representing a density difference between an actual density of an ink dot formed on the print medium and an ideal density of the dot (column 12, lines 49-67, column 20, lines 60-65 and column 19, lines 64-65);

deviation correction means (CPU 102) for performing a dot deviation correction based on deviation data representing an amount of deviation, or a difference, between an actual landing position of an ink dot formed on the print medium by the ink droplets ejected from each nozzle and an ideal landing position of the ink dot (column 1, lines 31-43, column 14, lines 10-13 and 32-35); and

control means (CPU 102) for selectively causing the deviation correction means to execute the dot deviation correction according to the amount of deviation and for controlling the grayscale correction means and the deviation correction means according to at least the density different and the amount of deviation (column 20, lines 60-65);

difference

wherein the amount of deviation is an amount which is obtained according to a result of measuring a landing state of each of the dots formed by the ink droplets ejected from nozzles of the print head onto the print medium by measuring the landing state corresponding to each of the nozzles (column 1, lines 31-43, column 14, lines 10-13 and 32-35).

With regards to claims 23 and 24, a method involving performing the functions outlined above as steps for forming an image in an ink jet printer.

With regards to claim 14, when the amount of deviation of an ink dot of interest is found to be greater than a predetermined value, the control means causes the deviation correction means to execute the dot deviation correction (when the value is greater than an average value, correction is performed, column 19, lines 54-63).

With regards to claim 15, the deviation correction means corrects an ink ejection condition of at least one influencing nozzle that adversely affects an ink dot of interest in landing on the ideal landing position (column 20, lines 4-8).

With regards to claim 16, the at least one influencing nozzle includes at least one of a nozzle for ejecting an ink droplet to form the ink dot of interest and adjoining nozzles (column 21, lines 8-13).

With regards to claims 17 and 18, when the amount of deviation exceeds 10% or 25% of a nozzle pitch, the control means causes the deviation correction means to execute the dot deviation correction (Takahashi et al. corrects errors which cause a difference in density, a deviation greater than 10% or 25% causes a deviation in density, for example, an error of 1,000% would read on the claims and would surely be corrected by Takahashi et al.).

With regards to claim 19, the grayscale correction means corrects, based on the density data, an ink ejection condition of a nozzle corresponding to the density data (column 20, lines 4-8).

With regards to claim 20, the deviation correction means increases or decreases a volume of an ink droplet ejected from an influencing nozzle according to the amount of deviation, the influencing nozzle being a nozzle that adversely affects an ink dot of interest in landing on the ideal landing position (column 20, lines 66-67).

With regards to claim 21, the grayscale correction means increases or decreases a volume of ink droplet ejected from the influencing nozzle according to a magnitude of the density difference (column 20, lines 66-67, changing drive pulse or width affects the drop size).

With regards to claim 22, the control means controls the deviation correction means and/or the grayscale correction means according to nozzle information representing at least one ejection characteristic of each nozzle (density data represents an ejection characteristic of the nozzle), the at least one ejection characteristic including at least one of an ink ejection enable/disable decision for each nozzle and a size and/or shape of an ink dot (size and/or shape, column 14, lines 10-14 and 32-35).

Claim Rejections - 35 USC § 103

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

6. Claims 3 and 9 are rejected under 35 U.S.C. 103(a) as being unpatentable over Takahashi et al. in view of Shioya (PGPUB 2001-0003458 A1).

Takahashi et al. discloses everything claimed, including that the nozzle information generation means determines a size or shape of an ink dot (column 14, lines 10-14 and 32-35), with the exception of determining an ink ejection enable/disable decision for each nozzle.

Shioya discloses determining an ink ejection enable/disable decision for each nozzle based on a density difference (fig. 9, step S904). If a density difference is large, a disable decision is made and a complementary printing process is performed, while if the density difference is small, ink volume change is made to correct the density difference.

It would have been obvious to one having ordinary skill in the art at the time of the invention to incorporate the teachings of Shioya into the invention of Takahashi et al. for the purpose of enabling an image of good quality to be produced even when a nozzle has failed to such a degree that a density difference cannot be corrected through drop volume modulation (page 8, section 0104 and 0082).

Response to Arguments

7. Applicant's arguments filed 30 September 2005 have been fully considered but they are respectfully not persuasive.

Applicant argues that Takashi does not measure the landing state of each of the dots by measuring the landing state corresponding to each nozzle.

As admitted by applicant, "Takahashi corrects an image formed by a plurality of dots ejected by individual nozzles by reading the density" (see page 24, second to last paragraph of remarks).

A discussion of the term "landing state" follows and through such discussion, it will be shown that the term "landing state" encompasses the density of the droplets; thus it will be shown that Takahashi teaches the claimed invention.

Words of the claim are generally given their ordinary and customary meaning, unless it appears from the written description that they were used differently by the applicant. Where an applicant chooses to be his or her own lexicographer and defines terms with special meanings, he or she must set out the special definition explicitly and with "reasonable clarity, deliberateness, and precision" in the disclosure to give one of ordinary skill in the art notice of the change. See *Teleflex Inc. v. Ficosa North America Corp.*, 299 F.3d 1313, 1325, 63 USPQ2d 1374, 1381 (Fed. Cir. 2002), *Rexnord Corp. v. Laitram Corp.*, 274 F.3d 1336, 1342, 60 USPQ2d 1851, 1854 (Fed. Cir. 2001), and MPEP 2111.01. Pursuant to 35 U.S.C. 112 2nd paragraph, "It is applicant's burden to precisely define the invention and not the examiner's." *In re Morris*, 127 F.3d 1048, 1056, 44 USPQ2d 1023, 1029 (Fed. Cir. 1997). There, it would not be proper for the examiner to give words of the claim special meaning when no such special meaning has been defined by the applicant in the written description.

The examiner contends that applicant has not provided an explicit definition in the written description for this term found in the claims.

Office personnel are to give claims their broadest reasonable interpretation in light of the supporting disclosure. *In re Morris*, 127 F.3d 1048, 1054-55, 44 USPQ2d 1023, 1027-28 (Fed. Cir. 1997). Limitations appearing in the specification but not recited in the claim are not read into the claim. *E-Pass Techs., Inc. v. 3Com Corp.*, 343 F.3d 1364, 1369, 67 USPQ2d 1947, 1950 (Fed. Cir. 2003) (claims must be interpreted "in view of the specification" without importing limitations from the specification into the claims unnecessarily). *In re Prater*, 415 F.2d 1393, 1404-05, 162 USPQ 541, 550-551 (CCPA 1969). See also *In re Zletz*, 893 F.2d 319, 321-22, 13 USPQ2d 1320, 1322

(Fed. Cir. 1989) ("During patent examination the pending claims must be interpreted as broadly as their terms reasonably allow.... The reason is simply that during patent prosecution when claims can be amended, ambiguities should be recognized, scope and breadth of language explored, and clarification imposed.... An essential purpose of patent examination is to fashion claims that are precise, clear, correct, and unambiguous. Only in this way can uncertainties of claim scope be removed, as much as possible, during the administrative process.").

The broadest reasonable interpretation of the term landing state is clear; landing state refers to the state of the drop after it lands. This may include, but is not limited to, color, density, size or position. Accordingly, based on the broadest reasonable interpretation, Takahashi discloses the relevant limitation.

Attention is now directed to applicant's written description, page 37, line 26-page 38, line 1, wherein it is stated that "This dot landing state is equal in printed density to 95% of an ideal dot landing state". This is the most relevant portion of the written description, that clearly uses the term landing state in context. Here, applicant distinguishes between landing states by referring to density. Thus clearly, even in light of applicant's written description, Takahashi discloses the relevant limitation.

Conclusion

8. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Julian D. Huffman whose telephone number is (571) 272-2147. The examiner can normally be reached on 10:00a.m.-6:30p.m. Monday-Friday.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Stephen Meier can be reached on (571) 272-2149. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
